Sustainability of Malaysian
and Indonesian Palm Oil

Guidelines for the collection of Sustainable Jurisdictions Indicators data at the district level

Working paper

KAMI

Funded by
the European Union

Chapter 1: Introduction

1.1 Background

Sustainable Jurisdiction Indicators (SJI) is an initiative led by the Agricultural and Food Directorate of the Ministry of National Development Planning/Bappenas, supported by the European Union and other partners. The objective of the initiative is to achieve the development agenda which is listed in the National Mid-term Development Plan (RPJMN) 2020–2024, in the context of Priority Program Implementation (PP) of the improvement of added value, employment, real sector investment, and industrialisation – Priority Activity (KP) on the increase of Agriculture-based Processed Industry, marine, and upstream-downstream integrated Non-Agricultural industry. The sustainable jurisdictions narrative has also been integrated in the RPJMN 2024-2029 and the National Long-Term Development Plan (RPJPN) 2024-2045. In line with the government agenda, SJI is expected to provide guidelines for planning and the performance of an area in implementing sustainable principles in the production process of plantation commodities.

SJI is designed to provide several benefits, as an instrument that helps regions to measure, and gradually achieve, sustainability and inclusiveness in agricultural development. The central government is also able to use the indicators and the SJI monitoring system to develop incentives and disincentives for regional governments to achieve sustainable and inclusive development. Those needs can be fulfilled because SJI is prepared in line with regulations and policies which support certification scheme on sustainable agricultural commodities, such as Indonesian Sustainable Palm Oil (ISPO). Moreover, SJI aims to help each region assess and monitor if they are in line with plantation policies in each city/district in Indonesia, such as the Regional Action Plan of Sustainable Palm Oil (RAD-KSB).

Direct benefits for regions of using the SJI instrument include: (1) Contributing to the performance achievement of regional development, especially to achieve the UN Sustainable Development Goals; (2) Contributing to the effectiveness and the efficiency of financial and human resources allocation in sustainable development implementation; (3) Increasing the regional GDP contribution in green development sectors; (4) Developing and providing the regional portfolio related to green investment; and (5) Encouraging non-fiscal incentive schemes related to regional sustainable development.

1.2 Sustainable Jurisdictions Indicators (SJI)

The Sustainable Jurisdictions Indicators (SJI) were developed based on a jurisdictional approach at the district level. This approach is in accordance with the agricultural responsibility delegation to the district government as regulated in Law No.23 of 2014 concerning regional government. A jurisdictional approach is one of the landscape approaches which uses administrative boundaries (i.e. jurisdiction) to define action scope, activity, and stakeholders' involvement.

There are two types of SJI indicators: the main indicators (based on national data) and additional optional indicators (based on regional data). The usage of regional data to

measure the optional indicators can accommodate initiatives that have been carried out by the regional government, but where the data does not exist at the national level.

Through a multi-stakeholder approach, 24 indicators have been developed to measure the sustainable and inclusive production of commodities at the district level – 18 main indicators and 6 optional indicators. The SJI fall under three sustainability dimensions: environmental, socio-economic, and governance. Each sustainability dimension has principles, criteria and indicators to guide regional governments in fulfilling the SJI targets.

1.3 Sustainable Jurisdictions Indicators platform

A data platform has been developed to facilitate the analysis and the dissemination of the data regarding the indicators, in order to provide information for policy makers and market players. The dashboard is the main feature of SJI platform. It consists of two main features: district assessments and district profiles. The following is further explanation of each dashboard feature.

District assessment – This feature is used to assess a how each district/city fares against each SJI indicator.

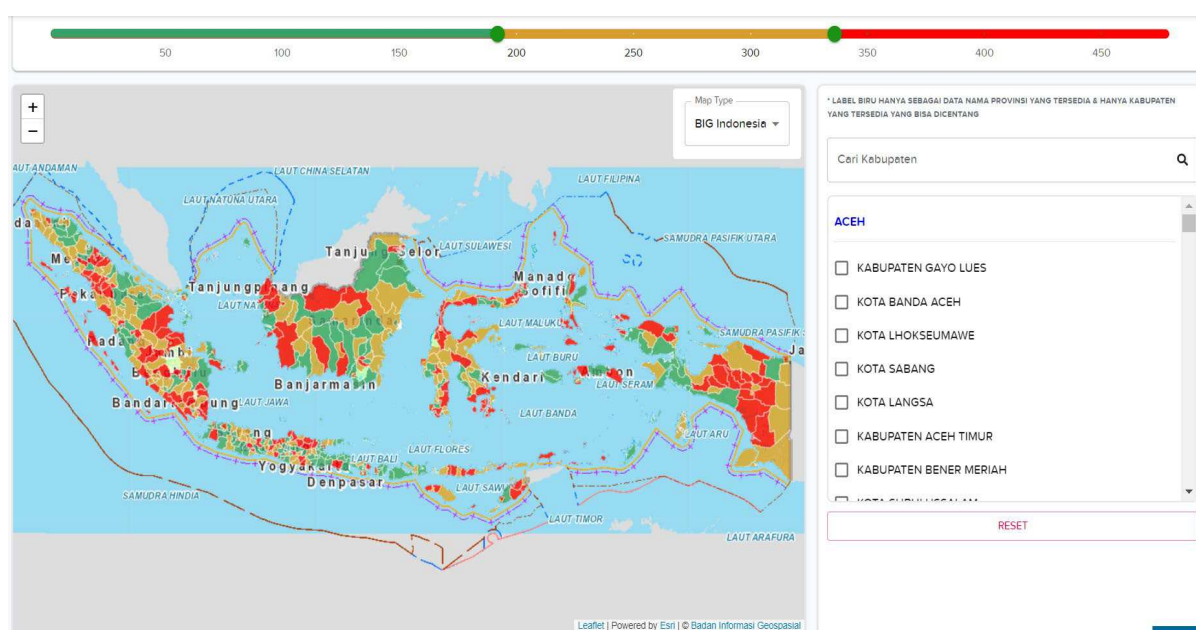

Figure 1: Indonesia map with districts' SJI data

District profile – This feature is used to view the results, profile or the achievement of individual districts/cities. Different from the district assessment, this feature is able to look one district/city its progress towards achieving all the SJI indicators.

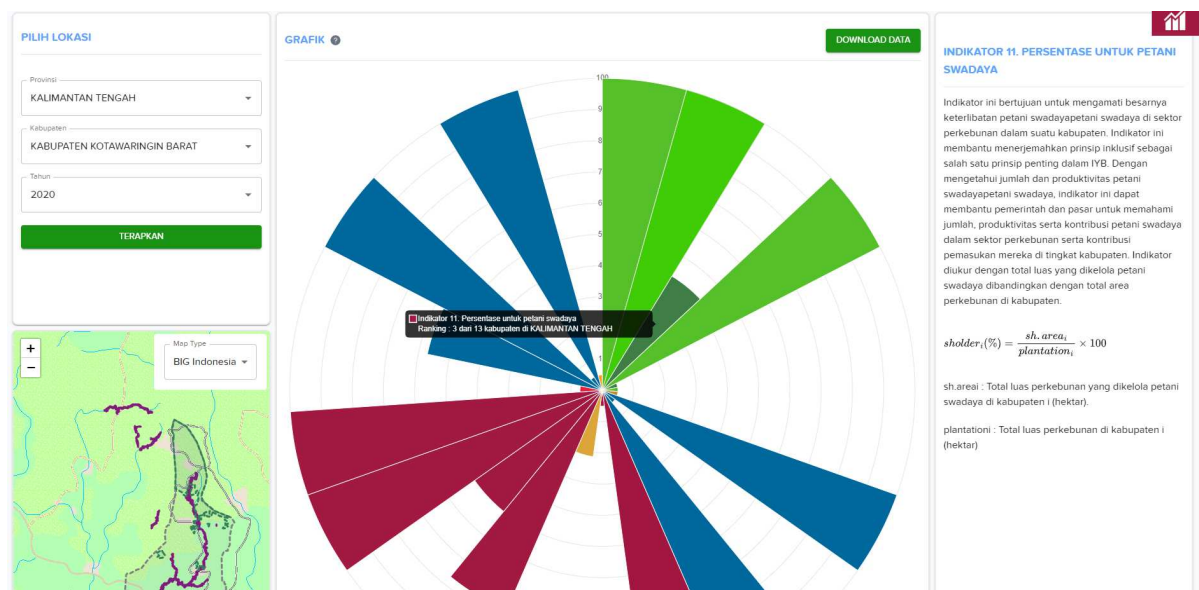

Figure 2: District SJl indicator display chart

This platform is important to support market players in conducting due diligence, and also in decision making related to resources and investment based on sustainability performance at the district level. Bappenas is currently developing this platform further to support the process of development planning, to assist with funding allocation to help the districts to improve their performance, and attracting green investment.

The platform also can show the trends and the progress from over time, highlighting districts that have made significant progress towards sustainability, as well as identifying areas that need further support. Further development will include the addition of a palm oil supply chain tracking module to help fulfil new due diligence requirements in order to access global markets.

Furthermore, the Ministry of Internal Affairs is preparing the integration of SJl into the Regional Government Information System (SIPD) to monitor the implementation of Sustainable Palm Oil Regional Action Plans (RAD-KSB).

1.4 Using the guidelines

These guidelines provide explanations and descriptions of the 24 SJl indicators as a resources for local governments, which are responsible for collecting the relevant SJl data at the district level. Chapter 2 contains descriptions of each indicator. Chapter 3 outlines the type of data and data holder for each indicator. Chapter 4 outlines the procedures for collecting and improving SJl data. This document therefore provides guidance for district/city governments in:

1. Supporting data collection for SJl indicator fulfillment.
2. Determining the SJl data collection steps.
3. Outlining the roles/task division of various sectors or related services for SJl indicator fulfillment.

Chapter 2: Description of the Sustainable Jurisdictions Indicators

2.1 Environmental indicators

PRINCIPLE		Indicators
ENVIRONMENTAL DIMENSION	Environmental and natural resources management in districts is carried out sustainably, taking into account aspects of environmental carrying capacity in order to support Sustainable Development Goals.	Indicator 1: Permanent Forest Protection. This indicator measures the percentage of the total designated areas with protection function in the district spatial planning by designing from the appointed and/or determined total areas as forest areas with protection or conservation function in those district areas.
		Indicator 2: Conservation as an important areas for ecological services. This indicator measures the percentage of appointed total area with conservation function in the district spatial planning from the total area of Essential Ecosystem zone (KEE) which stretches along the district areas.
		Indicator 3: Fire Prevention. This indicator calculates the increase or the decrease of unburned forest areas (in hectare) every year, weather along the extreme years or normal years.
		Indicator 4: Protection for peatlands. The indicator measures the percentage of the appointed total area with protection function in the district spatial planning from the total of peatlands with protection function which determined by the national government in those district areas.
		Indicator 5: Environmental Quality Control. The indicator measures the condition of environmental quality through Environmental Quality Index (IKLH).
		Indicator 6: Climate Change Mitigation and Adaptation. This indicator assesses climate change mitigation and adaption effort in the regions which covers (1) The existence of greenhouse gas emission inventory (GRK) and/or the existence (2) climate change adaptation action plan in district level.

2.2 Socio-economic indicators

	PRINCIPLE	Indicators
SOCIO-ECONOMIC DIMENSION	Sustainable district development accelerates the strength and resilience of regional socio-economic progress, recognises the rights of local communities/indigenous peoples and supports the participation of farmers in order to ensure inclusivity (no one left behind), freedom from hunger, and poverty eradication.	
		Main Indicator
		Indicator 7: The proportion of land control by the independent smallholders. This indicator calculates the proportion of total areas which managed by the independent smallholders to the total plantation area in certain districts.
		Indicator 8: Registration of Independent Smallholders. The indicator calculates the percentage of independent smallholders who have STDB compares to the total independent smallholders in districts.
		Indicator 9: Numbers of farmer members who joined in independent smallholders association/group. The indicator is measured by calculating the total ratio of farmers who have been joined in Farmer groups/Smallholder association in a district.
		Indicator 10: Assistance for independent farmer. The government has various assistance for independent farmer. In this stage, the indicator calculates the ratio of agricultural/plantation extension workers who provided by the government to a numbers of villages in jurisdiction level. The provision of extension workers help the independent smallholders to access various others governmental assistance.
		Indicator 11: Food Security. This indicator uses Food Security Index (IKP) which issued by National Food Body (BPN). IKP assesses food availability, food insecurity, and food affordability in an area.
		Indicator 12: The contribution of PDRB in Plantation Sector. The indicator calculates the percentage of PDRB on forestry sector to the total of PDRB in a region.
		Optional Indicator
		Indicator A: Recognition of Customary Law Communities. The indicator measures the achievement of customary land rights recognition by considering the government support to the acceleration of customary forest determination by the Ministry of Environment and Forestry (KLHK), as well as the releasing of customary land from the state forest areas.
		Indicator B: Independent Smallholders Productivity. The indicator is measured by calculating the productivity of superior commodities in an area.
		Indicator C: Farmer Partnership. This indicator measures the commitment of regional government in monitoring the independence of farmer association (cooperative, farmer group, farmer group association) through supply chain partnership.

2.3 Governance indicators

	PRINCIPLE	Indicators
GOVERNANCE DIMENSION	Sustainable district development meets good governance practices so that the regional sustainability target is planned, implemented, and monitored objectively, openly, participatorily.	
		Main Indicator
		Indicator 1: Permanent Forest Protection. This indicator measures the percentage of designated total area with protection function in district spatial planning which determined from the total area which appointed and/or determined as forest area with protection or conservation function in the district area.
		Indicator 14: The proportion of district budget allocated for sustainability. This indicator calculates the budget percentage which allocated for environment function divided by the total district budget listed in the APBD each year.
		Indicator 15: Public Information Access. Public information access can be measured through various ways. In this stage, this indicator assesses the existence of policies related to the appointment of Information and Documentation Management Officers (PPID) in the region.
		Indicator 16: Complaint Mechanism. This indicator assesses the region commitment in the implementation of National Public Services Complaint Management System - Community Online Complaint and Aspiration Services (SP4N-LAPOR).
		Indicator 17: Sustainable Plantation Certification. The indicator measures the percentage (%) of the plantation total area that has been certificated. In this stage, this certification uses ISPO to see the palm oil plantation area that has been certificated as sustainable, compared to the total palm oil plantation area in a district.
		Optional Indicator
		Indicator D: Multi-stakeholder participation in district planning. This indicator assesses the existence of SOP(s) concerning the Development Planning Meeting which regulates community participation in annual spatial development planning preparation and mid-term development planning in a region.
		Indicator E: The existence of Multi-stakeholder Institutions (KMP). This indicator assesses the existence of multi-stakeholder institutions in a region for sustainable development purposes.
		Indicator F: Free, Prior and Informed Consent (PADIATAPA/FPIC) integrated in the plantation licensing application process. This indicator assesses the existence of SOP for receiving community approval related to plantation permits in a district.
		Indicator G: Land and Agricultural Conflict Resolution. This indicator assesses the existence of SOP concerning the handling of agricultural and land conflicts at the regional government level.
		Indicator H: The Implementation of PUP (Plantation Business Assessment) This indicator assesses the percentage of PUP implementation by local government, or the percentage of companies with Class I PUP (very good) and Class II (good) scores against the total plantation companies in a region.

Chapter 3: Sustainable Jurisdictions Indicators data and data holders in the districts

The table below lists the required data for each indicator (both main and optional indicators), as well as the source of the data ('data holder') and the required format. The data and information outlined in the table is needed to analyse the sustainability of a region at the district level.

Table 1: Sustainable Jurisdictions Indicators data and data holders in the districts

No.	Indicator	Name of Data	Data Holder	Ministry/Institution	File Format
MAIN INDICATOR					
1	Protection for Permanent Forest	Protected Forest map in the district in District's RTRW (Spatial Planning Regional Planning)	Regional Planning Development Agency (Bappeda)/ Public Works and Public Housing Department in district level	District Government	zip (file .shp dan file .dbf)
		Conservation Forest map in the district in District's RTRW (Spatial Planning Regional Planning)	Regional Planning Development Agency (Bappeda)/ Public Works and Public Housing Department in district level	District Government	zip (file .shp dan file .dbf)
		New License Moratorium Map (PIPPIB) in the district	Directorate of Inventory and Resources Monitoring	Ministry of Environment and Forestry	zip (file .shp dan file .dbf)
		Protection forest map in the district in Forest Areas Closure Decree (PKH)	Directorate of Forest Area Establishment and Management	Ministry of Environment and Forestry	zip (file .shp dan file .dbf)
		Conservation forest map in the district in PKH decree	Directorate of Forest Area Establishment and Management	Ministry of Environment and Forestry	zip (file .shp dan file .dbf)
2	Protection for Important areas for ecological services	RTRWK map with protection function in the district	Regional Planning Development Agency (Bappeda)/ Public Works and Public Housing Department in district level	District Government	zip (file .shp dan file .dbf)
		Essential Ecosystem Areas in the district	Public Works and Public Housing Department/ Directorate of Ecosystem Management and Rehabilitation	Regional government/ Ministry of Environment and Forestry	zip (file .shp dan file .dbf)
3	Fire Prevention	Area of fire in the district (https://sipongi.menlhk.go.id/)	Regional Disaster Management Agency in the district	District Government	csv, xls, atau dbf

No.	Indicator	Name of Data	Data Holder	Ministry/Institution	File Format
4	Protection for Peatlands	Land map included in peat hydrology which is in the protection function area/region that identified in Spatial Planning Regional Planning (RTRW) in the district.	Regional Planning Development Agency (Bappeda)/ Environmental Services in the district / Public Works and Public Housing Department	District Government	zip (file .shp dan file .dbf)
		Peat map with protection function	Directorate of Peat Ecosystem Damage Control	Ministry of Environment and Forestry	zip (file .shp dan file .dbf)
5	Environmental Quality Control	Environmental Quality Index (IKLH) in the district	Environmental Services in the district	District Government	csv, xls, atau dbf
6	Climate Change Mitigation and Adaptation	Climate Change adaptation/mitigation action plan policy document in district level	Regional Planning Development Agency (Bappeda)/ Environmental Services in the district / Legal Bureau of District Government	District Government	
7	Proportion of Land Control by Independent Farmers	Total area of plantation managed by independent farmer in the district	District Agricultural/Plantation Services	District Government	csv, xls, atau dbf
		Total area of plantation in the district	District Agricultural/Plantation Services	District Government	csv, xls, atau dbf
8	Independent farmers Registration	Numbers of independent farmer who has SDTB in the district	District Agricultural/Plantation Services	District Government	csv, xls, atau dbf
		Numbers of independent farmer in the district	District Agricultural/Plantation Services	District Government	csv, xls, atau dbf
9	Number of Farmers Association/independent farmers groups	Numbers of farmer group (plantation) in the district	District Agricultural/Plantation Services	District Government	csv, xls, atau dbf
		numbers of independent farmer in the district	District Agricultural/Plantation Services	District Government	csv, xls, atau dbf
10	Independent farmers assistance	Numbers of plantation extension workers in the district	District Agricultural/Plantation Services	District Government	csv, xls, atau dbf
		Numbers of independent farmer in the district	District Agricultural/Plantation Services	District Government	csv, xls, atau dbf
11	Independent Farmers Productivity	Numbers of the Palm Oil production of Independent farmer in the district	District Agricultural/Plantation Services	District Government	csv, xls, atau dbf
		Total area of plantation managed by independent farmer in the district	District Agricultural/Plantation Services	District Government	csv, xls, atau dbf

No.	Indicator	Name of Data	Data Holder	Ministry/Institution	File Format
12	Food Security	Food Security Index (http://app2.badanpangan.go.id/)	District Food Security Services	District Government	csv, xls, atau dbf
13	Contribution of PDRB to the Plantation Sector	Annual publication data from the Central Statistics Agency (BPS) on Gross Regional Domestic Product (GRDP) for each district in Indonesia (District in Figures)	District Central Statistics Agency (BPS)	District Central Statistics Agency	csv, xls, atau dbf
14	Sustainable Land Use Planning	District list which has district DDDTLH document	District Environmental Services	District Government	csv, xls, atau dbf
		District list which has district RPPLH document	District Environmental Services	District Government	csv, xls, atau dbf
15	District Budget Proportion allocated for sustainability	Regional Revenue and Expenditure Budget (APBD) for sustainability/environment (https://djpk.kemenkeu.go.id/?p=5412)	District Environmental Services	District Government	csv, xls, atau dbf
		District Level Regional Revenue and Expenditure Budget (APBD) (https://djpk.kemenkeu.go.id/?p=5412)	District Environmental Services	District Government	csv, xls, atau dbf
16	Public Information Access	The existence of regional regulation/regent's decree on the appointment of PPID officers in the district	District Communication and Information Office	District Government	csv, xls, atau dbf
17	Complaint Mechanism	District list that is operating SP4N-Lapor	District Communication and Information Office	District Government	csv, xls, atau dbf
18	Sustainable Certified Plantation	The total area of Palm Oil Plantation which is RSPO and/or ISPO certified in the district	District Agricultural/Plantation Services	District Government	csv, xls, atau dbf
		Total area of palm oil plantation in the district	District Agricultural/Plantation Services	District Government	csv, xls, atau dbf
OPTIONAL INDICATORS					
A	Recognition of Customary Law Communities	Indicative map of district customary forest	Directorate of Conflict Management. Customary Forest and Tenure	Ministry of Environment and Forestry	zip (file .shp dan file .dbf)
B	Multi-stakeholder participation in district planning	The existence of SOP/regulation related to the community participation in the implementation of development planning meeting in the district Ada tidaknya SOP/	Regional Planning Development Agency in the district (Bappeda)	District Government	csv, xls, atau dbf
C	The existence of multi-parties institution (KMP).	Regent's decree or other policies that determines the establishment of multi-stakeholder institutional forum for the development sustainability in the district	Regional Planning Development Agency (Bappeda) in the district / District Law Bureau	District Government	pdf.

No.	Indicator	Name of Data	Data Holder	Ministry/Institution	File Format
D	Prior and Free Informed Consent (PADIATAPA) integrated into the plantation permit application process	SOP/ regulation in the district concerning the community approval related to the plantation permit application	District Law Bureau	District Government	csv, xls, atau dbf
E	Conflict Resolution	The existence of SOP/regulation in the district concerning the handling of land and agricultural conflicts in the district	District Law Bureau	District Government	csv, xls, atau dbf
F	The implementation of PUP (Plantation Business Assessment).	The report of the implementation of Plantation Business Assessment (PUP) in a district which can be obtained from Agricultural services or plantation services	District Agricultural/ Plantation Services	District Government	csv, xls, atau pdf, dbf

Chapter 4: Procedures for collecting and improving Sustainable Jurisdictions Indicators data

The process of collecting and improving SJI data should follow a process which starts with a preparation phase and continues through data collection, verification, input, improvement, reporting and ultimately integration with wider regional planning efforts. This process is the result of a study of SJI data collection implementation in pilot districts. The details of the process for collecting data in district/cities government are as follows:

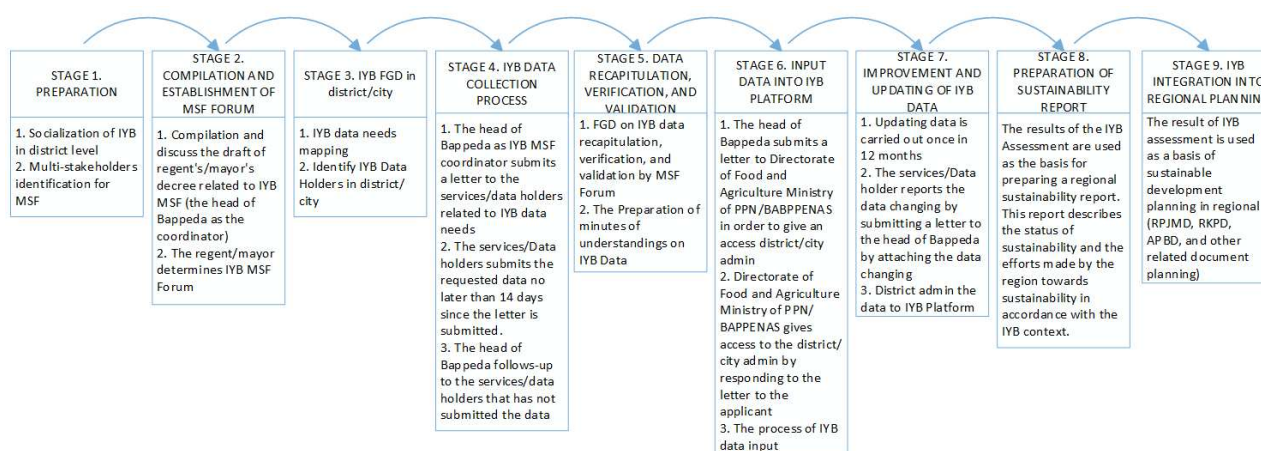

Figure 3: Flow of the SJI data collection process in district/city governments

Stage 1. Preparation. This first step calls for conducting socialisation with relevant agencies and entities at the district level to explain and raise awareness about SJI. The target of the socialisation activities should be the services/agencies in the district/city government who are themselves, or are related to, the SJI data holders, as well as any other relevant parties. The socialisation should cover (1) An explanation of SJI, including the objectives and the calculation mechanism; (2) SJI scope of work and the procedures for implementation; and (3) How to input SJI data to the digital platform

Stage 2. Preparation and the establishment of MSF SJI Forum. After the socialisation, the next step is to identify the actors to be included as part of the SJI Multi-stakeholder Forum (MSF). First, drafting of a regent's/mayor's decree to establish the SJI MSF is coordinated by the district/city Bappeda. Under the decree, the head of Bappeda should be appointed as the coordinator of SJI data collection. The SJI MSF is responsible for overseeing each service/agency at the district/city level which conducts SJI data collection, as well as submitting the data to the SJI MSF coordinator. The district/city coordinator is also responsible to evaluate the data collection process, including the availability or unavailability of data, and level of data completeness. The district/city coordinator is also responsible for reporting the progress of the SJI data fulfillment activity to the Regional Secretary and/or regent/mayor.

Stage 3. Focus Group Discussion (FGD) concerning SJI in the district/city. This stage is important for identifying data needs through a focused dialogue on the SJI indicators. The data requirements identified during the FGD should be outlined in a SJI data matrix, then the local services/agencies which are the data holders should be identified for each. The resulting matrix should be submitted to the head of Bappeda (as the coordinator of SJI MSF).

Stage 4. Data collection. The head of Bappeda collects the required data from each of the services/agencies identified as the data holders, by submitting a formal letter of request to the services/agencies. They should be given 14 days to fulfill the request and provide the data by submitting it to the district/city Bappeda along with a report or other proof of data submission.

The head of Bappeda can appoint additional Bappeda staff in the district to assist with the data collection process. If the services/agencies (data holders) do not provide the required data by the deadline, the coordinator should visit each service/agency to follow up.

Stage 5. Data summarisation, verification and validation. The coordinator, together with the relevant district services/agencies, carry out a data summarisation process. This can be done through a series of FGDs carried out periodically until all the data is summarised, verified and validated. Through this process, a list should be created outlining the data requirements for each SJI indicator, then inserting information on the data collected where appropriate/relevant, as well as noting where data is not available. The following format can be used:

Table 2: Suggested format for Sustainable Jurisdictions Indicators data recapitulation

No.	Indicator	Name of Data	Data Holder	File Format	Data availability		Data Recapitulation
					Available	Unavailable	
1.	Indicator 1.	Data 1.....		zip (file .shp dan file .dbf, PDF, JPEG dll)			 Ha
		Data 2.....		zip (file .shp dan file .dbf, PDF, JPEG dll)			 Ha
2.	Indicator 2.	Data 1.....		zip (file .shp dan file .dbf, PDF, JPEG dll)			 Ha
		Data 2.....		zip (file .shp dan file .dbf, PDF, JPEG dll)			 Ha

After the data summary table is completed, the next step is to conduct data verification and validation, through the following three stages:

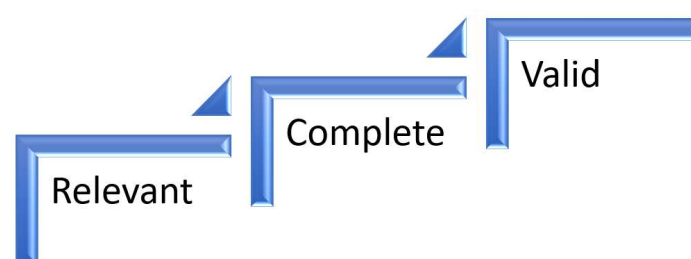

Figure 4: The process of data summarisation, verification and validation

The three stages of data verification and validation are to identify:

1. **Relevance.** The existing data or document is compared to the data requested for the SJI indicator fulfillment. If the data/document is considered relevant, continue to the next step (verification).
2. **Completeness.** The existing data or document fully meets the expectation for the SJI fulfillment (i.e. provides all the information needed). If it only provides partial information it can still be included as supporting data, with a note that it does not meet all the information needs.
3. **Validation.** Confirming that the data provided comes from legitimate sources, the data holder has the rights to publish it, and it does not violate the law. If these criteria are not met, that data cannot be used.

The table below can be used to facilitate the data verification and validation process:

Table 3: Suggested format for Sustainable Jurisdictions Indicators data verification and validation

No.	Indicator	Data Recapitulation	Data Verification and Validation					
			Relevance		Completeness		Validation	
			Relevant	Irrelevant	Complete	Incomplete	Valid	Not Valid
1.	Indicator 1.							
								
2.	Indicator 2.							
								

Stage 6. Input data into the SJI platform¹. After the data has been collected, verified and validated, it can be input into the SJI platform. To gain access to the platform:

- The head of Bappeda must register in the platform as the district administrator.
- The head of Bappeda must send a letter to the Directorate of Food and Agriculture (Dit PP) the Ministry of PPN/Bappenas requesting to be named the district administrator for the platform.
- Bappenas approves the request, sending the head of Bappeda a letter including the account name and password needed to log into the platform.

Once access to the platform is granted, the head of Bappeda should delegate Bappeda staff as administrators to handle the SJI data input process. The data input procedures are outlined in a separate set of guidelines regarding use of the SJI platform.

Stage 7. Data improvement and updating SJI data. After the initial data is input into the platform, updates to the data should be carried out periodically, focusing on data which can change regularly. Updating data in the platform should be carried out at least once a year. The services/agencies which are data holders must report to the district/city coordinator when there is a change or update to their SJI data. Regarding data improvement, the district government should periodically re-collect data that was already provided but not adequately summarised, verified or validated.

Stage 8. Sustainability reporting. One of the benefits of SJI is as a practical reference for preparing a sustainability report for the district/city jurisdiction level. Through a sustainability report the district/city government, as well as stakeholders in a region, can communicate the targets of the local planning sustainability and their performance in achieving the targets based on the three pillars of SJI (environmental, socio-economic and governance). The sustainability report also can help district government in determining their future

¹ <https://efi.kami.ptsj.co.id/>

development priorities, and the roles and the involvement of other stakeholders (community, private, and development partner) in the regional development process.

The SJI platform can provide district/city governments with the following data and information for sustainability reports:

- **Environmental:** the latest condition and the district/city performance in permanent forest protection, important area protection for ecological services, forest fire prevention, peatland protection, climate change mitigation, sustainable production forest management, environmental quality control.
- **Socio-Economic:** The latest condition and the district/city performance in the proportion of land ownership by independent planters, the number of registered independent planters, the number of planters who joined in independent farmer associations/farmer groups, assistance available for independent farmers, the productivity of the independent farmers, food security, poverty level, the recognition of Customary Law Community.
- **Governance:** the latest condition and the district/city government performance in sustainability land planning, the budget proportion allocated for sustainability, sustainable certified plantations, public information access, participation of stakeholders in the development planning, complaint mechanism, if Free, Prior and Informed Consent (Padiatapa/FPIC) is integrated in the plantation permit application process, land and agriculture conflict resolution, and the implementation of Plantation Business Assessments (PUP).

A sustainability report template can be downloaded from the SJI platform.

Stage 9. SJI integration into regional planning processes. The SJI platform provides as assessment of a district's sustainability based on the latest data included. This assessment will identify indicators where the district is performing well, as well as indicators that need improvement through an enhanced sustainable agenda and programme in the region. District governments should integrate their assessment results into various district plans (e.g. RPJMD, RKPD, APBD, other related plans). This integration will improve the assessment capabilities of the SJI platform, and help drive sustainability efforts in the district.

Chapter 5: Closing

To encourage district governments towards sustainable development, the Sustainable Jurisdictions Indicators can be an assessment tool to better understand the extent to which sustainable development is being carried out the district level. More broadly, the Sustainable Jurisdiction Indicators are an important tool for achieving development goals, especially sustainability in the agricultural and plantation sectors at the district level, in line with the national development priorities in the RPJMN 2025 - 2029.

These guidelines are intended to assist regions in collecting and improving their data, making it easier to progress towards fulfilling each of the Sustainable Jurisdictions Indicators.
